XML Tutorial

출처 : w3schools.com/xml

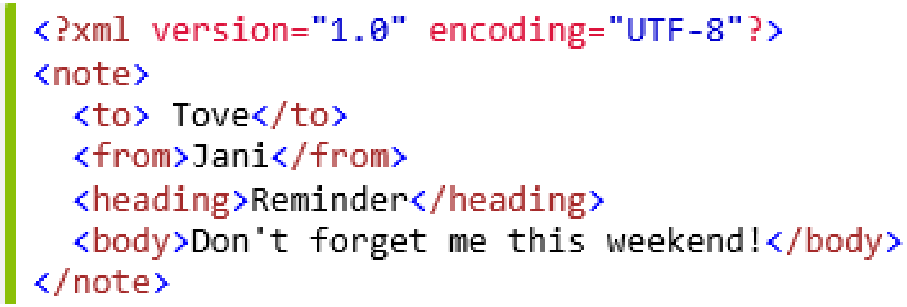
XML Basic

XML History

- 1970년대 중반, 찰스 F. 골드팔:
  - ✓ SGML (Standard Generalized Markup Language)
  - ✓ 데이터 표현의 국제적 기준 제시
- 1980년대 중반, 팀 버너스-리:
  - ✓ World Wide Web 고안, W3C 결성
- W3C 첫 번째 활동
  - ✓ HTML (Hypertext Markup Language) Spec.
  - ✓ 형식과 문서 텍스트의 레이아웃 설명 체계 제공
- 1990년대 후반, e-비즈니스 발전
  - ✓ 표준 비즈니스 중심의 데이터 표현 형식 요구.
  - ✓ For example, XML (Extensible Markup Language)
  - ✓ 메타 정보(자기 묘사가 가능한 태그) 제공

XML

- XML stands for eXtensible Markup Language
- XML is designed to describe data
- XML is a software- and hardware-independent tool for carrying information
- XML is easy to learn



```
<?xml version="1.0" encoding="UTF-8"?>
<note>
  <to> Tove</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>Don't forget me this weekend!</body>
</note>
```

With Style >>

Introduction to XML

XML was designed to describe data.
HTML was designed to display data.

What You Should Already Know

Before you continue you should have a basic understanding of the following:

- HTML
- JavaScript

Introduction to XML

What is XML?

- XML stands for Extensible Markup Language
- XML is a markup language much **like HTML**
- XML was designed to carry data, not to display data
- XML tags are not predefined. You must define your own tags
- XML is designed to be self-descriptive
- XML is a W3C Recommendation

Introduction to XML

The Difference Between XML and HTML

- XML is not a replacement for HTML
- XML and HTML were designed with different goals:
  - ✓ XML was designed to describe data, with focus on what data is
  - ✓ HTML was designed to display data, with focus on how data looks

- HTML is about displaying information,

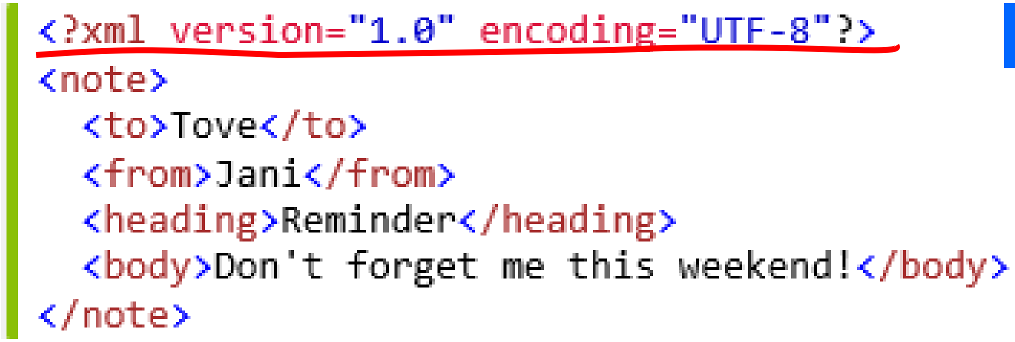
  while XML is about carrying information.

XML Tree

XML documents form a tree structure that starts at "root" and branches to "leaves".

An Example XML Document

- XML documents use a self-describing and simple syntax:

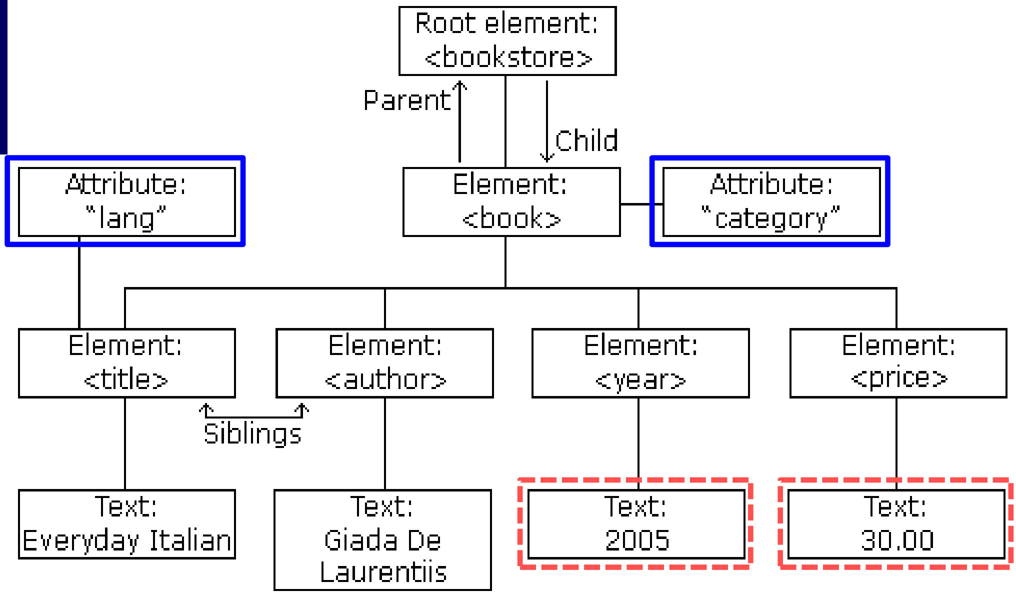


```xml
<?xml version="1.0" encoding="UTF-8"?>
<note>
  <to>Tove</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>Don't forget me this weekend!</body>
</note>
```

“UTF-8”

- The first line is the XML declaration

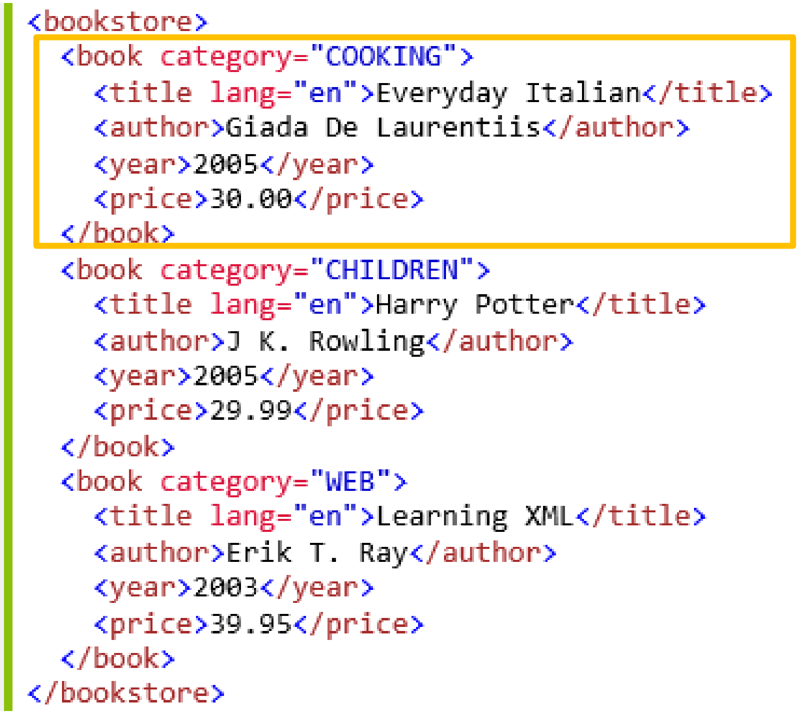
XML Tree



All elements can have text content and attributes

The image above represents one book in the XML below:

books_tree.xml

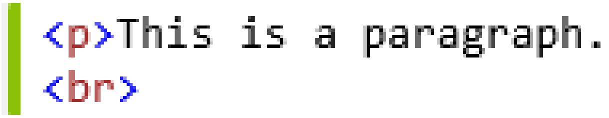


```
<bookstore>
  <book category="COOKING">
    <title lang="en">Everyday Italian</title>
    <author>Giada De Laurentiis</author>
    <year>2005</year>
    <price>30.00</price>
  </book>
  <book category="CHILDREN">
    <title lang="en">Harry Potter</title>
    <author>J K. Rowling</author>
    <year>2005</year>
    <price>29.99</price>
  </book>
  <book category="WEB">
    <title lang="en">Learning XML</title>
    <author>Erik T. Ray</author>
    <year>2003</year>
    <price>39.95</price>
  </book>
</bookstore>
```

XML Syntax

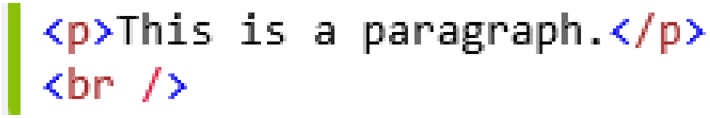
All XML Elements Must Have a Closing Tag

- In HTML, some elements do not have to have a closing tag:



```
<p>This is a paragraph.
<br>
```

- In XML, it is illegal to omit the closing tag
  - ✓ All elements must have a closing tag:



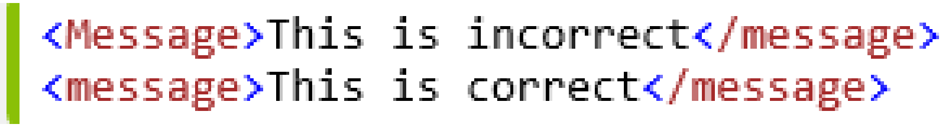
```
<p>This is a paragraph.</p>
<br />
```

XML Syntax

XML Tags are Case Sensitive

- XML tags are case sensitive
  - ✓ The tag <Letter> is different from the tag <letter>

- Opening and closing tags must be written with the same case:

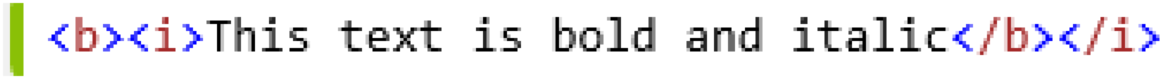


```
<Message>This is incorrect</message>
<message>This is correct</message>
```

XML Syntax

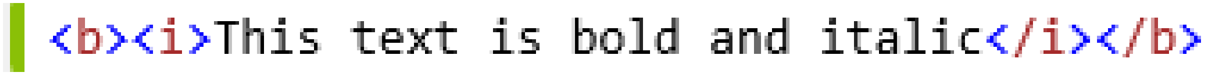
XML Elements Must be Properly Nested

- In HTML, you might see improperly nested elements:



```
<b><i>This text is bold and italic</b></i>
```

- In XML, all elements must be properly nested within each other:



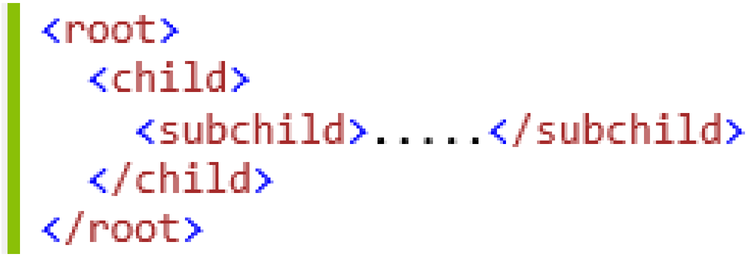
```
<b><i>This text is bold and italic</i></b>
```

- "Properly nested" simply means that since the <i> element is opened inside the <b> element, it must be closed inside the <b> element

XML Syntax

XML Documents Must Have a Root Element

- XML documents must contain one element that is the parent of all other elements. This element is called the root element.

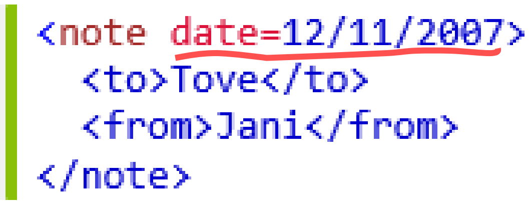


```
<root>
  <child>
    <subchild>.....</subchild>
  </child>
</root>
```

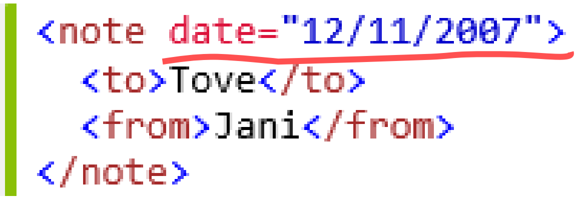
XML Syntax

XML Attribute Values Must be Quoted

- XML elements can have attributes in name/value pairs just like in HTML
- In XML, attribute values must always be quoted
- Study the two XML documents below. The first one is incorrect, the second is correct:



```
<note date=12/11/2007>
  <to>Tove</to>
  <from>Jani</from>
</note>
```



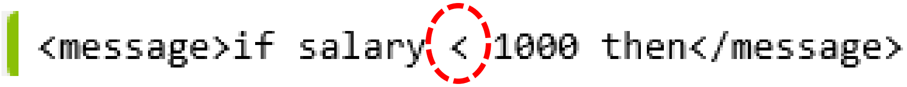
```
<note date="12/11/2007">
  <to>Tove</to>
  <from>Jani</from>
</note>
```

XML Syntax

Entity References (1/2)

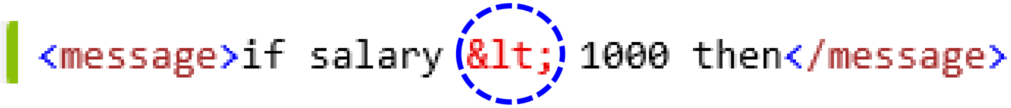
- Some characters have a special meaning in XML
- If you place a character like "<" inside an XML element, it will generate an error because the parser interprets it as the start of a new element

- This will generate an XML error:



```
<message>if salary < 1000 then</message>
```

- To avoid this error, replace the "<" character with an entity reference:

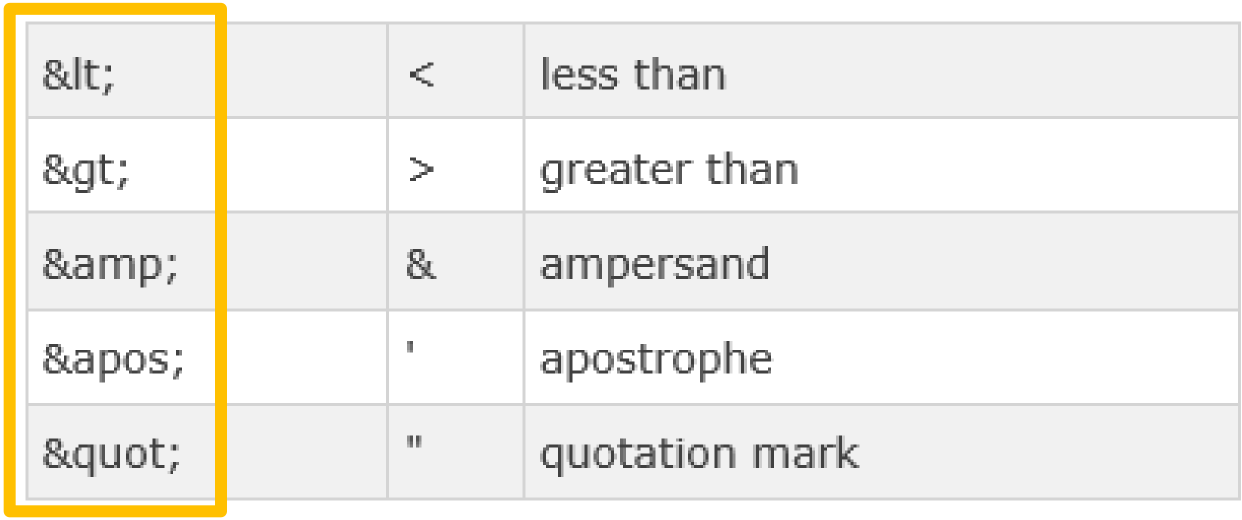


```
<message>if salary &lt; 1000 then</message>
```

XML Syntax

Entity References (2/2)

- There are 5 predefined entity references in XML:



&lt;	<	less than
&gt;	>	greater than
&amp;	&	ampersand
&apos;	'	apostrophe
&quot;	"	quotation mark

XML Syntax

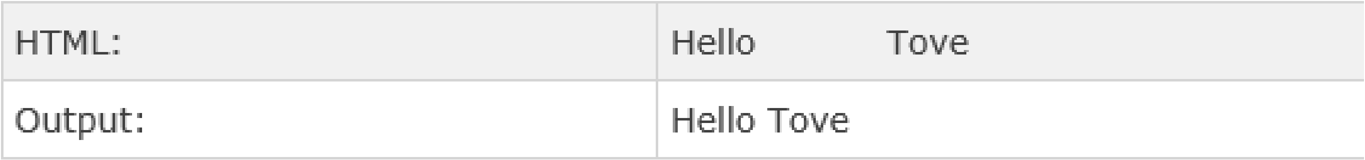
Comments in XML

- Syntax for writing comments in XML is similar to that of HTML

  <!-- This is a comment -->

White-space is Preserved in XML

- HTML truncates multiple white-space characters to one single white-space:
  (HTML은 여러 개의 공백 문자를 하나의 공백 문자로 자릅니다.)



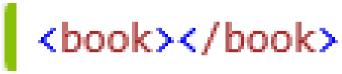
HTML:	Hello Tove
Output:	Hello Tove

- With XML, the white-space in a document is not truncated
  (XML에서는 문서의 공백이 잘리지 않습니다.)

XML Elements

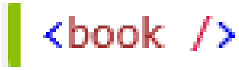
Empty XML Elements

- An alternative syntax can be used for XML elements with no content:
- Instead of writing a book element (with no content) like this:



```
<book></book>
```

- It can be written like this:

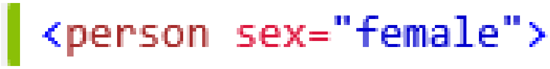


```
<book />
```

XML Attributes

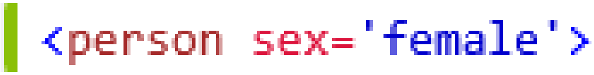
XML Attributes Must be Quoted

- Attribute values must always be quoted
  - ✓ Either single or double quotes can be used. For a person's sex, the person element can be written like this:



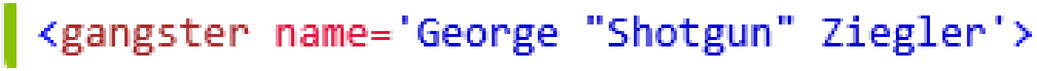
```
<person sex="female">
```

or like this:



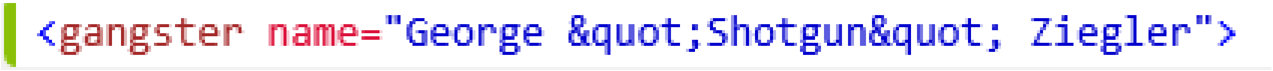
```
<person sex='female'>
```

- If the attribute value itself contains double quotes, you can use single quotes, like in this example:



```
<gangster name='George "Shotgun" Ziegler'>
```

- or you can use character entities:

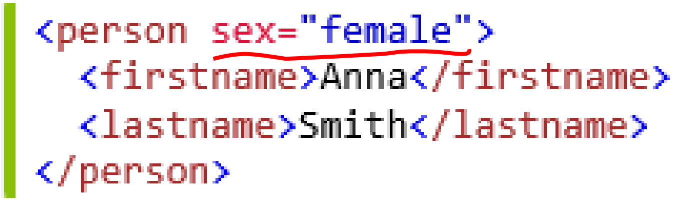


```
<gangster name="George &quot;Shotgun&quot; Ziegler">
```

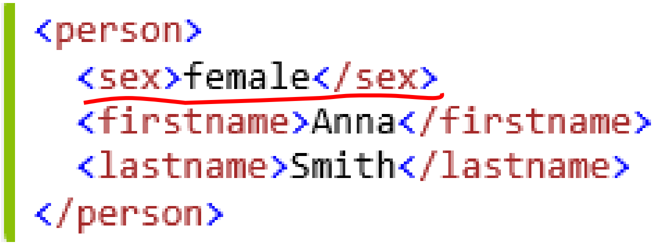
XML Attributes

XML Elements vs. Attributes

- Take a look at these examples:



```
<person sex="female">
  <firstname>Anna</firstname>
  <lastname>Smith</lastname>
</person>
```



```
<person>
  <sex>female</sex>
  <firstname>Anna</firstname>
  <lastname>Smith</lastname>
</person>
```

Both examples provide the same information

- There are no rules about when to use attributes or when to use elements
- Attributes are handy in HTML
- In XML my advice is to avoid them. Use elements instead
